The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyAh RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; congestive heart failure; dilative cardiomyopathy; sudden death; hypetrrophic cardiomyopathy; intythm disorder; heart muscle disease; conduction disorder; coronary heart disease; systemic arterial hypertension; pulmonary hypertension; endocarditis; pulmonary heart disease; valvuiar heart disease; valvuiar heart disease; valvuiar heart disease; pericardial disease; congenital heart disease; gene therapy; syncope; transgenic animal; expressed sequence tag; EST; clone 66214; ds.

tissues and their corresponding proteins. The invention also relates to methods for assessing the expression level of these genes. The method is used for testing the predisposition of mammals and preferably humans for a heart disease or for an acute state of such a disease. It is also useful to treat diseases of the heart such as congestive heart failure, dilative cardiomyopathy, hypertrophic cardiomyopathy, ischaemic cardiomyopathy, specific heart muscle disease, rhythm and conduction disorders syncope and sudden death, coronary heart disease, systemic arterial hypertension, pulmonary hypertension, pulmonary heart disease, congenital heart disease, pericardial disease and endocardiis. Sequences of the invention are also used in gene therapy, are useful for the development for medicaments for the treatments of heart disease. The present DNA sequence is expressed sequence tag
                                                                                                           Identifying a subject at risk for a heart disease e.g. congestive heart failure, dilative cardiomyopathy, heart muscle disease, by quantifying the polypeptide expressed by genes abnormally expressed in heart tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chisel gene; Csl; EF-Hand protein super family; muscle development; heart/Sekeletal muscle call development; signalling pathway; regulation; XQ21.3-q22, adaptive process; muscle homeostasis; skeletal myopathy; detection; diagnosis; prophylaxis; treatment; cardiac hypertrophy; muscular and myotonic dystrophy; buchenne muscular dystrophy; therapy; Becker's myotonic dystrophy; heart failure; differentiation; exon; gene therapy; transgenic animal; drug screening; ss.
                                                                                                                                                                                                                                              The patent discloses novel target genes abnormally expressed in heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            229 GCAAATATCAATATTCCAATGGGAGCCTTTCGGCCAGGAGGCAGGGGTCAACCCCCCAGAAGA 288

The present sequence is the cDNA encoding the human chisel gene (Cal) that is mapped to the human chromosome Xq21.3-q22. It comprises 5 exons. It is a member of the EF-Hand protein super family and is involved in signaling pathways. It is predominantly expressed in heart and skeletal muscles and is activated after the differentiation of calls. Cal functions in regulation aspects of differentiation or adaptive processes that maintain muscle homeostasis. This sequence can be used in the detection, diagnosis, prophylactic and therapeutic treatment of diseases cut as those involving aberrant muscle call development and functional activity. It is also used in the treatment of muscular and myotonic dystrophy, heart failure, cardiac hypertrophy and myocarditis, myofiber atrophy, eart failure, cardiac hypertrophy, myocarditis, myofiber atrophy, etc. The Cal gene sequence can also be used in gene therapy, for the production of transgenic animals and for

myofiber atrophy, etc. The Cal gene sequence can also be used in gene therapy, for the production of transgenic animals and for drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the cDNA encoding the murine chisel gene (Csl) that is mapped to the mouse X chromosome. It is a member of the EF-Hand protein super family and is involved in signalling pathways. It is predominantly expressed in heart and skelatal muscles and is activated after the differentiation of cells. Csl functions in regulation aspects of differentiation or adaptive processes that maintain muscle homeostasis. This sequence can be used in the detection, diagnosis, prophylactic and therapeutic treatment of diseases such as those involving aberrant muscle cell development and functional activity. It is also used in the treatment of muscular and myotonic dystrophies, skeletal myopathies such as buchenne muscular dystrophy and Becker's myotonic dystrophy, heart failure, cardiac hypertrophy, myocarditis,
                                                                                                                                                                                                                                              Chisel gene; Csl; EF-Hand protein super family; muscle development; heart/skeletal muscle cell development; signalling pathway; murine; X chromosome; regulation; adaptive process; muscle homeostasis; detection; diagnosis; prophylaxis; treatment; skeletal myopathy; muscular and myotonic dystrophy; Duchenne muscular dystrophy; therapy; Becker's myotonic dystrophy; heart failure; cardiac hypertrophy; differentiation; gene therapy; transgenic animal; drug screening; ss.

This sequence represents CDNA encoding maize endosperm C-24 sterol
methyltransferase ESMT-1. The CDNA encoding ESMT-1 was selected from an
EST (expressed sequence tag) database on the basis of its sequence
identity with the N-terminal portion of the yeast ERG6 protein. The
predicted amino acid sequence of ESMT-1 shows 66% similarity and 46%
control predicted amino acid sequence of ESMT-1 shows 66% similarity and 46%
control predicted amino acid sequence of ESMT-1 shows 66% similarity and 46%
control methyltransferases, respectively. ESMT-1 catalyses the
alkylation of sterol intermediates at carbon 24. Nucleic acids encoding
ESMT-1 may be used in the generation of transgenic plants having altered
maintenance of membranes of most eukaryotic cells; however, insects,
nematodes and some species of fungi do not produce their own sterols,
contained and some species of fungi do not produce their own sterols,
contained and some species of fungi as their life cycles. DNA encoding
ESMT-1 is useful in altering sterol metabolism in plants and protects
contained and some species of fungi sterol metabolism in plants and some
confinging Plants produced using ESMT-1 DÑA are resistant to pest
infestation, without the need for chemical pesticides which may be toxic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /*tag= a /*tag= A /*tag= //product= "Maize C-24" sterol methyltransferase ESMT-1"

This DNA molecule codes for the S-adenosyl-L-methionine-delta24(25)
sterol methyltransferase (SMT) enzyme (see AAM70838) of corn. SMT
catalyses the transfer of a methyl group from S-adenosyl-L-methionine
to the C-24 centre of the sterol side chain. Full-length corn SMT
cDNA was isolated from a commercial corn cDNA library by PCR
amplification. The invention relates to transgenic plants with
modified sterol biosynthetic pathways. Phytosterol compositions are
modified sterol biosynthetic pathways. Phytosterol compositions are
modulated in the transgenic plants to confer resistance to insects,
nematodes, pythiaceous fungi and/or other environmental stresses
such as drought or cold, and/or to improve nutritional value, e.g.
by increasing levels of cholesterol-lowering sterols. SMT DNA
molecules (including antisense molecules) can be transformed into
plant cells, and plants (especially tomato, corn or soybean) having
altered sterol compositions are then regenerated.
                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-mallgnant condition; to monitor the progression of cervical cancer or a premallgnant condition in a patient, and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                     Cervical cancer; cytostatic; pre-malignant condition; gene therapy; ss.
                                                                                New isolated nucleic acid for diagnosing and treating cervical cancer and for assessing and detecting compounds for treating the cancer -

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polymucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
couplement diseases and polymucleotides may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
collinear and cancer metastrases of haematopoietic-related diseases, especially
diagnose and treat immune/haematopoietic-related diseases, especially
cancers and cancer metastrases of haematopoietic antigen genomic
conformation the present invention. AAK84942 to AAK87691 and AAM82169
crepresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               6464 AAATACAAAAATTCGCTGGGCATGGTGGCAGGCAGCCTCAGGAGGCTGAGAAGAAT 6523

The invention describes a method of monitoring differential expression of genes in a first Bacillus cell relative to expression of the genes in other Bacillus cells, comprising hybridising labelled nucleic acid probes isolated from Bacillus cells to a substrate concaining array of Bacillus genomic sequenced tags (GST), examining the array, and determining calative gene expression by an observed hybridisation reporter signal of a spot in the array. The method is useful for measuring the expression of genes in a first Bacillus cells relative to expression of the same genes in one or more second Bacillus cells. The method is useful for monitoring opposible functions of unknown open reading frames and genes in one copy number variation and stability. Monitoring changes in expression of genes may be used to provide a representation of the way in expression of genes may be used to provide a representation of the way in which Bacillus cells adapt to changes in culture conditions, and the manal stress or other physiological provocation. Extensive follow—up characterisation is unnecessary, when one spot on an array cequals one gene or one open reading frame, since sequence information is available. This sequence represents a genemic information is not not the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                   Monitoring differential expression of several genes in first Bacillus cell relative to expression of same genes in one or more second Bacillus cells, by using substrate containing Bacillus genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ftp.wipo.int/pub/published_pct_sequences.

The present invention describes primer sets for synthesising 5602

full-length cDNAs defined in the specification. Where a primer set

comprises: (a) an oligo-dT primer and an oligonucleotide complementary

to the complementary strand of a polynucleotide which comprises one of

oligonucleotide comprises at least 15 nucleotides; or (b) a combination

of an oligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

sequence and an oligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

sequence and an oligonucleotide comprising a sequence complementary to a

polynucleotide which comprises a 1'-end sequence, where the

oligonucleotide which comprises a 1'-end sequence, where the

complementary strand of a polynucleotide out the combination of

the 5'-end sequence 13'-end sequence is selected from those defined in

the specification. The primer sets can be used in antisense therapy and

in gene therapy. The primers are useful for synthesiang polynucleotides,

constant full-length cDNAs. The primers are also useful for the

detection and/or diagnosis of the abnormality of the proteins encoded by

constant and seasily without any specialised methods. AAH03166 to AAH13628 and

AAH3633 to AAH13642 represent human cald sequences; and AAH13629 to AAH13632

represent oligonucleotides, all of which are used in the exemplification

of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                              AAX20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrella infections in animals, and for the production of biosynthetic products such as enzymes.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
cc activity, and can be used in gene therapy and vaccine production. (I)
c proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) axpression. For
cx mample, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient 's genome
that affect the activity of (I) by expressing inactive proteins or to
constructedides may be used to produce the secreted (I), by inserting
cc supplement the patients own production of (I). Additionally, (I)
cc supplement the patients own production of (I). Additionally, (I)
cc supplement the patients own production of (I), by inserting
cc the nucleic acids into a host cell and culturing the cell to express the
cc the nucleic acids into a host cell and culturing the cell to express the
cc diagnose and treat immune/haematopoietic-related diseases, especially
cc ancers and cancer metastasses of haematopoietic antigen genomic
cancers and cancer metastasses of haematopoietic antigen genomic
sequences from the present invention. AAK54942 to AAK87994 ceptesent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            7051 AAATTICAAAATTCAAAAGAAAGACTICTAGGCAATGAGAAAAGAATCCCATTTTAAATA 6992

The present invention describes isolated anthranilate synthase alphasbubnit (ASAS), and thranilate synthase beta-subunit (ASAS), and thranilate synthase beta-subunit (ASAS), and thranilate synthase beta-subunit (ASAS), and thranilate synthase alpha-subunit (TSAS) mucleic acids, and protein encoded by them, obtained from corn, rice, soybean and wheat cDNA in the nucleic acid fragments may be used to create transgenic libraries. The nucleic acid fragments may be used to create transgenic contents in which the disclosed ASAS, ASAS or TSAS are present at higher or lower levels than normally found. This would have the effect of altering which they are not normally found. This would have the effect of altering to the level of tryptophan in those cells. Manipulation of the levels of pathogen attack. Because this pathway is not followed for the production content the discovery of herbicides and fungicides. The ASAS, ASBS or TSAS can be used as targets to facilitate design and/or identification of inhibitors of those enzymes that may be useful as herbicides. Nucleic acid fragments can also be used a part of, and as markers for traits linked to those genes. Such information may be useful in plant breeding in order to develop lines with desired phenotypes. AAZ25109 to AAZ25127 represent specifically claimed nucleic acids from the present invention cand AAV42112 to AAV42112 represent the proteins encoded by them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         757 TCCAGGGTGTCCAATTCCACCCGGAGAGCATCATCACCCTGAAGGCAAGAAATCATCC 816

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and Br 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for bound to each probe of the microarray of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tay microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence data for this patent did not form part of the invention. Note: The sequences of the invention printed specification, but was obtained in electronic format directly from WIPO at ftp.WiPo.int/Pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; foetal liver; gene expression; single exon nucleic acid probe; ss.

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

'U'. The source of the chromosomes was a human/hamster hybrid,
GMOJ297-F, from Robert Nussbaum at the University of Pennsylvania
School of Medicine. Please contact the Lawrence Livermore National
Laboratory at http://www-bio.llnl.gov/genome to obtain the clone.
VECTOR: Lawristl6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality date (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                            Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi; Mammalia; Butheria; Primates; Catarrhini; Hominidae; Homo.

Patzak,D., Zhuchenko,O., Lee,C.C. and Wehnert,M.
Identification, mapping, and genomic structure of a novel
X-chromosomal human gene (SMPX) encoding a small muscular protein
Hum. Genet. 105 (5), 506-512 (1999)
Mohun, T. and Harvey, R.P. The small modifies cell shape and promotes myocyte fusion in an insulin-like growth factor labendant manner.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     245 GCGAATATCAATATTCCAATGGGAGCCTTTCGTCCGGGAGCTGGGCAGCTCCCAGAAGG 304

NOTE: This is a 'working draft' sequence. It currently consists of 46 contigs. The true order of the piaces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Submitted (11-JUL-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

Submitted (26-JUN-2002) Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On Jun 26, 2002 this sequence version replaced gi:21327310.
INFORMATION: http://www.hgsc.bcm.tmc.edu/ or email

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.

ANNOTATION OF FEATURES:

STSs are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and

local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

(More Acids Res. 25:3389-3402) similarity are identified by BLAST EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://www.hgsc.bcm.tmc.edu:8088/quality.info/genbank.annot ation.html.

/note="Organ: eye; Vector: pT773-Pac (Pharmacia) with a
modified polylinker; Site 1: EcoR I; Site 2: Not I;
UI-E-DXO is a cDNA library containing the following
tissue(s): fetal eyes. The library was constructed
according to Bonaldo, Lennon and Soares, Genome Research,
with an oligo-dT primer containing a Not I site. Double
with Not I, and cloned directionally into pT773-Pac
vector. The oligonucloctide used to prime the synthesis of
first-strand cDNA contains a library tag sequence that is
sequence tag for this library is AGAATCAAGA. This library
was created for the program, Gene Discovery in the Visual
System, supported by National Eye Institute (NEI)." 0; Gaps 0

/note="Organ: eye; Vector: pT7T3-Pac (Pharmacia) with a
modified polylinker; Site_1: EcoR I; Site_2: Not I;
UI-E-DX0 is a cDNA library containing the following
tissue(s): fetal eyes. The library was constructed
according to Bonaldo, Lennon and Soares, Genome Research,
6:791-806, 1996. First strand cDNA synthesis was primed
with an oligo-dT primer containing a Not I site. Double
stranded cDNA was ligated to an EcoR I adaptor, digested
with Not I, and cloned directionally into pT7T3-Pac
vector. The oligonucleotide used to prime the synthesis of
first-strand cDNA contains a library tag sequence that is
located between the Not I site and the (dT)18 tail. The
sequence tag for this library is AGAATCAAGA. This library
was created for the program, Gene Discovery in the Visual
System, supported by National Eye Institute (NEI)."
